

# Ruby on Rails

## Lab Exercise 7

1. Create an application that asks the user for three nouns, three verbs, four adjectives, and one name. Save that information in a cookie.
2. Create a view that reads the information in the cookie and tells a story using the words and the name the user provided. For a full explanation, read this: <http://www.itsamadlibsworld.com/index.php?p=definemadlibs>. Repeat this exercise using a session variable instead of a cookie.
3. Create views that delete the cookies and session variables you saved.

### Questions:

1. What is the difference between a cookie and a session?
2. When would you use a session variable and why?
3. What are some good uses for cookies?

(Hint: it will help to write a little story first and then decide which nouns and verbs to replace in the story.)
